Special Issue Information

Dear Colleagues,

Chromatographic techniques are gaining interest among the archaeological community as they allow the identification of organic residues from archaeological materials, an important source of information for archaeologists. These are often composed of complex mixtures of molecules that need to be resolved, a crucial step in molecular archaeology to identify biomarkers and provide information on the diet of our ancestors, habits, technologies, or to follow ancient trade routes.

The target of this Special Issue is to present the state-of-the-art in analytical chromatographic studies of organic residues on archaeological materials. Multidisciplinary projects with a broad timespan and geographical region where chromatography assumes an important role, procedures focusing on the best archaeological practices regarding organic residue studies, and experimental archaeology on searching for new biomarkers will also be valued.

Dr. César Oliveira

Guest Editor
